COMPANY: Stainless Foundry

ERP: B&L Odyssey

Founded in 1946, the Milwaukee, WI-based, 260-employee foundry produces castings for companies in the valve and pump, chemical, petrochemical, nuclear, pulp & paper, pharmaceutical, food & dairy, metering, military and instrumentation industries. Shipping a hefty four million pounds of product annually, they realized they had outgrown their manual system of order input and workflow, and that it should be automated, enabling their order-to-cash processing to drive faster production, shipping and billing.

"IntelliChief’s paperless process management has enabled Stainless Foundry’s production lead time to be reduced by 50%.” –Steve Cooke, Vice President of Sales & Marketing

Their challenges:
- Gaining visibility into order processing
- Enhancing workflow between departments
- Accelerating order/contract review lead time, and
- Reducing costs associated with paper: handling (invoice retrieval from filing cabinets, copying documents, updating log books, and lost orders due to capture ineffectiveness), significant storage space allotment.

“Once a customer order came in, there were a lot of steps required before it was entered into our enterprise resource planning system (ERP) B&L Odyssey,” stated Steve Cooke, Stainless Foundry’s Vice President of Sales & Marketing. “Engineering, Quality, Production and Customer Service were all involved in the order review process. Each area might have responsibilities from validating pricing, setting up new customers, providing samples – all based on the kind of order received and from whom. This meant a lot of room for error, shuffling paper between departments, lots of emails; overall an inefficient manual process.”

Stainless Foundry’s requirements included:
- Will work with their B&L Odyssey ERP
- Will capture emailed orders
- Workflow will handle their complex order process

After evaluating four vendors, Stainless Foundry selected IntelliChief, who integrated with B&L Odyssey, provided the document capture and workflow capabilities they needed, required less upfront configuration to fit their processes, and provided attentive ongoing maintenance and user support.

IntelliChief’s Impact

“IntelliChief’s paperless process management has enabled Stainless Foundry’s production lead time to be reduced by 50%,” conveyed Cooke. “This significant improvement also provides benefits of substantially fewer lost orders, enhanced visibility into the orders-to-cash process, and ultimately fewer customer complaints.” Functionally, orders are now uploaded to IntelliChief, validated against Odyssey, and routed to all respective parties involved in a structured electronic package. What was done manually by moving paper in batches through various departments is now cohesive in real time. IntelliChief’s accelerated order-to-cash processing allows access to the entire order packet directly from Stainless Foundry’s ERP screens, saving time and improving customer service. Through this automation, IntelliChief captures customer order documents regardless of how they are physically received - by email, fax or postal service. IntelliChief’s workflow assists in order processing by automating functions including new customer setup, expired pricing, credit checks and engineering approvals.

“IntelliChief’s user training enabled everyone interacting with the system to be comfortable with its usage quickly,” mentioned Cooke. “That helped achieve our system ROI within a year.”

“My advice to those considering automating their document capture and workflow: thoroughly understand your current process and what you want the future state to be,” commented Cooke. “IntelliChief’s business process specialists helped us immensely to assess our strengths and discover opportunities, and configured our IntelliChief system to suit our needs best.”
